Engineered & Solid Wood Flooring
At Manufacturer's Prices

BRITISH MADE

UK Wood Floors specialise in the manufacture of engineered and solid wood flooring for both residential and commercial use direct to trade & public and have over 40 years of installation experience and technical expertise.

Whether supply only or providing a full fitting service, we work closely with our customers to ensure a smooth installation process and unrivalled quality of flooring installation, sanding and finishing. We produce our own flooring and pride ourselves on the ability to ensure quality and value for money throughout the production, supply, fitting and finishing process.

With our bespoke finishing line we have full control of the production process so we can provide almost any specification that you require, be it planks or parquet, all 100% British made!

PLEASE NOTE THAT WHILST OUR PRODUCTION IS EXACTING AT EVERY STAGE OF THE PROCESS, NATURE DOES NOT CONFORM TO REQUIREMENTS. EVERY WOOD FLOOR IS UNIQUE, BEAUTIFUL AND ONE OF A KIND. THE COLOUR, GRAIN, KNOTS AND OTHER MARKINGS WILL VARY FROM SAMPLES AND FROM BATCH TO BATCH. WE WORK WITH NATURE, WE DO NOT EXPECT IT TO WORK FOR US.

 = Suitable for underfloor heating

2.5 Litres £66.50
approx. 30m² (2coats)

Adhesive Gun & 600ml Foil

£35.00

600ml £12.75

INFORMATION & INSTALLATION GUIDELINE

By following these guidelines you should ensure the successful installation of your wood flooring, however further consultation may be required as every installation has varying conditions.

The principal enemy of timber floors is excessive exposure to moisture or dryness. Having left our premises, we have no control over the conditions to which they are subjected. Wood is a naturally hygroscopic material and will always be prone to small movement depending on climatic conditions. If suitable care and treatment is not taken, inherent stresses in wood may be released, resulting in movement or distortion such as swelling, warping, splitting or even discolouration. No liability will be accepted when problems are moisture related.

It is very important that the flooring is not installed until site conditions are suitable. Prior to installation moisture and humidity readings should be taken from the area to be fitted. The relative humidity should be between 45% and 60%. The moisture content of the sub-floor should ideally be below 5%. In new buildings, the property should be fully enclosed to outside elements (roof, doors and windows installed). All wet trades (plumbing, plastering, painting etc) should be completed and dried out. Recommended acclimatisation period for the wood flooring is 7 days. The flooring should be stacked in piles of 10-15m² or have bearers inserted between packs of flooring to allow for air circulation at ambient room temperature. We strongly advise against storage or installation of wood flooring in buildings with recently plastered or screeded areas.

An engineered plank floor can be laid as a 'floating' floor over an appropriate underlay and glued in t&g with PVA adhesive, or fixed by secret nailing method to a suitable plywood or similar sub-floor, or to joists or battens. On level and dry concrete it can be directly fixed to the floor using an appropriate elasticated polymer adhesive. Engineered boards may initially display a bow when unpacked however this is normal and will be removed during the staggered joint laying process.

UNDERFLOOR HEATING

All of our engineered wood flooring is suitable for use over underfloor heating, subject to suitable site conditions, fitting method and adhesives being used. Please note the following important guidelines:

- After the underfloor heating has been commissioned the heating must run for approximately 2 - 3 weeks to assist the evaporation of moisture in cement-based sub-floors. Ensure that any patching or leveling of the sub-floor is complete prior to installation. The heating should still be run with other sub-floor compositions such as ply or chipboard.
- Prior to installation moisture and humidity readings should be taken from the area to be fitted (see above for recommended levels). The underfloor heating should be turned off a day beforehand to ensure readings are accurate. Once the sub-floor moisture levels are suitable for installation the heating can be turned on at low level and once installation is complete the heating should then be built up in stages to room temperature over a period of 10 days

AFTER INSTALLATION

It is important to maintain a stable humidity level all year round in order to preserve the wood's form and appearance. Wood is a hygroscopic material and due to its natural movement characteristics, slight cupping or crowning is sometimes unavoidable. The optimal humidity range for hardwood flooring is between 45 and 60%. Temperature should be maintained at about 18 - 24 degrees Celsius. If underfloor heating is used a maximum sub-floor temperature of 26 degrees should be observed. Temperatures in excess of this may cause excessive movement and can lead to delamination of engineered boards and/or splits appearing in the surface of the wood. Gaps appearing between the boards indicate a drying out of the wood and insufficient degree of humidity. Temperature variations can also lead to some 'creaking' being heard from the flooring. The installation of a humidifier or air exchange system can prove indispensable in controlling humidity. Above all, don't forget that wood is a living material and that we must look after it for life. A proper care programme should always be observed. By following these simple guidelines you will maintain the natural beauty of your floor.

(FULL MAINTENANCE INSTRUCTIONS AVAILABLE ON REQUEST)

GRADING & TOLERANCE SPECIFICATIONS

PRIME (AB GRADE) Grain & colour variation, minimal sap, small sound knots allowed, moisture content 8% +/-2%.

RUSTIC (ABCD GRADE) Natural grain & colour variation, contains sap, medullary rays, open knots (filled), surface splits, moisture content 8% +/-2%, grading is mixed so consistency of appearance cannot be guaranteed.

BESPOKE FINISHES Floors finished with a coloured oil or stain can have an uneven appearance due to sap and the grain density in timber and may vary from samples. This should be noted prior to purchase.

TOLERANCES: WIDTHS +/-1mm, Lengths: +/-1mm, Thickness: +/-1mm, Bevel: 0.5mm, Lengths: average lengths of boards cannot be guaranteed.

PLEASE NOTE whilst our production is exacting at every stage of the process, nature does not conform to requirements. Every wood floor is unique, beautiful and one of a kind. The colour, grain, knots and other markings will vary from samples and from batch to batch. We work with nature, we do not expect it to work for us.

DELIVERY Please note that the carriers are contracted to deliver to the entrance of the premises specified. It is the Customers responsibility to ensure that the goods can be delivered to the room of their choice. Any damage to flooring delivered or shortages in quantity should be reported to the Company within 24 hours of delivery. Please do not sign for unchecked unexamined goods. In the unlikely event of goods being damaged in transit, signing in such a way invalidates our insurance and therefore a claim will not be accepted. The Company will use reasonable endeavours to comply with agreed Delivery dates, however the Company will not be liable for any loss due to delay.
